

### **R S S – the Reference Super Sub.**

Definition and punch, like you never experienced before.

Time. The third and most important dimension of sound, is the main focus of the R S S. Only a genuine horn can produce it correctly and unlock the physical feel, emotion and definition of the original music signal. Hear and feel the difference to standard vented designs.

A 10 year R & D project with only one goal, to design the fastest and most accurate, best sounding subwoofer system possible today, without size or cost restrictions. Resulted in this unique, genuinely horn loaded 40kW subwoofer system of eight enclosures, together forming a perfect 30Hz horn. Each enclosure is driven by a single special 18" driver, with the strongest and fastest motor structure.

Applications	In outdoor applications used in full packs of eight enclosures, to achieve the perfect 30Hz reproduction. In large indoor applications, packs of four enclosures can be used as part of a larger array. In small indoor clubs, even packs of two enclosures result in the best possible sounding bass.
Dispersion	Dependent on array setup and processing. A very large horn, is always naturally directional.
Bandwidth	27Hz to 200Hz -3dB acoustic system response. With 22Hz -10dB Low frequency cutoff.
Max SPL (combined system)	157dBpeak in half space (2Pi). Powered by 5kW dedicated processed amplifier power per cabinet.
Size / Weight	Width 600mm   Height 1750mm   Depth 1080mm   157kg per cabinet
